

FORTRESS TOP WALL ANCHORAGE SYSTEM ■ ■ ■

Soil movement and settlement against a foundation is generally enough to compromise the structural integrity of a home or building. Fortress Kevlar Neckties provide a secure anchorage system to stabilize a foundation that has moved inwards as a result of top wall movement.

Fortress Neckties may be used in conjunction with Fortress Carbon Fiber/Kevlar Grid Straps or Carbon Fiber Countersunk Staples to further enhance the structural reinforcement of a foundation wall.

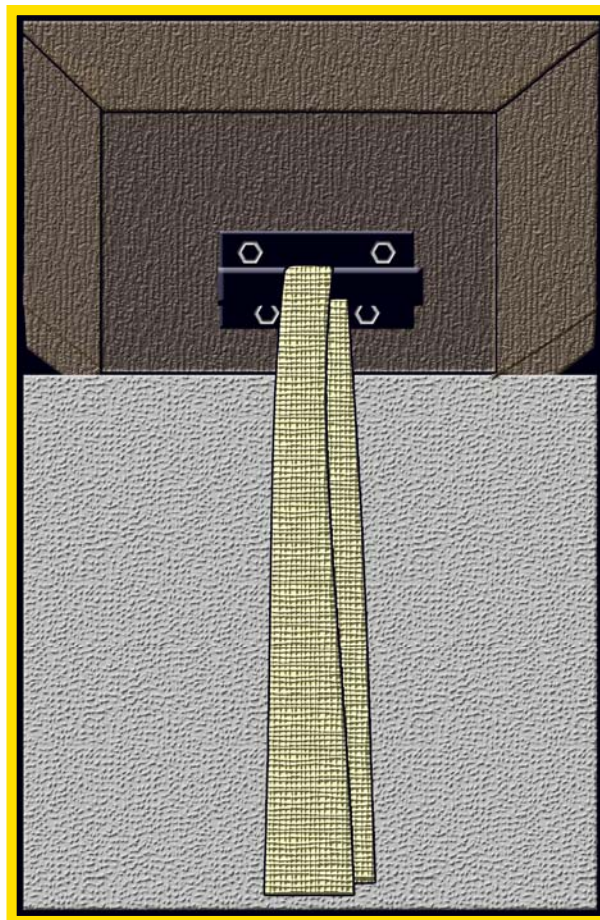

Fortress Kevlar Necktie Advantages:

- Fast and easy installation
- Low profile
- Flame retardant
- Non-corrosive
- Conforms to all building types
- Does not affect ceiling height
- Able to be installed where duct work and plumbing would traditionally need to be removed
- Protects the value of the home

Kevlar Necktie

The Fortress Necktie top wall anchorage should be used anywhere that plate separation is present, especially within the center of a foundation wall. Fortress Neckties can be installed between floor joists on load bearing walls or on non-load bearing walls, spaced apart at a maximum of 4 feet.
